abgulati / kosmos-2_5-contain...

CodeIssuesPull requests

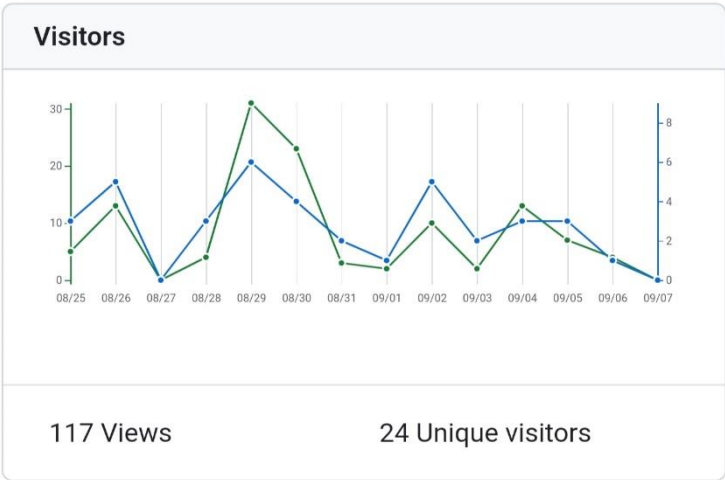

Kosmos-2.5 is a cutting-edge Multimodal-LLM (MLLM) specializing in image OCR. However, its stringent software requirements & Python-script based invocation make it difficult to use for application development. Here, it has been containerized and made available via an API, greatly enhancing its ease-of-use.

RAG for Documents with Advanced Source Citat...
198 upvotes • 63 comments

 mertysn • 26m

This is crazy impressive. I bookmarked it when you first posted and now I've had a chance to examine it. Just wow. Once you're done finalizing the features, whether you make it free or paid, it's going to be big. Of course, that's unless your competition has a big marketing budget. If your onboarding is smooth enough, there are a lot of enterprise customers lined up and waiting for such a tool.

 AbheekG **OP** • Now

There have been some massive updates recently, including an entire backend LLM server that I developed myself. In addition, we now have re-ranking! And a GoogleDrive loader (reach out to me for the access token if you wish to use it). I published v2.0-beta2 yesterday, do check it out!

    1

RAG for Documents with Advanced Source Citat...
198 upvotes • 64 comments

 desexmachina  +1 • 89d

What an absolutely great concept. Naive question here, but how hard would it be for you to add some SQL integration?

  Reply   2 

 AbheekG **OP**  • 89d

Thank you! It's not technically hard to add SQL integration, it's practically hard for cases where you want your RAG system to semantic-search databases: do you get the LLM to write and execute queries on the database, or a set of databases? Well that's never a great idea because goodness knows what it'll execute over your data, so at the very least you need to heavily curtail its user rights and you definitely should have replication over your databases, with your LLM only talking to your duplicates. This of course adds cost and overhead to your infrastructure: not only are your managing twice as many databases, but also the replication policies and costs for them!

SomeOddCodeGuy 🦊 • 90d

I have to say, I love all the creative RAG solutions that have been hitting LocalLlama recently. It's taking me forever to parse through each one, but I'm exceptionally thankful to every one of you. Solutions like this are what will help local AI remain a viable alternative to proprietary stuff for a long time to come.

 darkotic · 35d

Nice! Most apps bundle llama.cpp that I use and they're always behind instead of making it easy to grab models from HF or update the engine to support new models.

As someone that has been experimenting with abulati's LARS RAG application, I can say that there are some really nifty implementations in his projects, so looking forward to what this one can do. The LARS app is browser served on a LAN where the RAG docs and inferencing are performed on a central compute unit.

Coding_Zoe • 54d

Awesome thanks a lot!. All the OCR type models are over my noob head to install/run, so anything that helps simplifies it to get it up and running is much appreciated!

What is the minimum hardware you would need to run this OCR model do you think? Also would be it suitable for 100% off-line use? Using it as a local API.

Thanks again.

AbheekG OP 🏆 • 54d

Hey you're most welcome! While you only needs approx 10GB VRAM, as noted in my post, use of FlashAttention2 necessitates **very specific generations of Nvidia GPUs**. You can see the specifics in greater detail in my repo: https://github.com/abgulati/kosmos-2_5-containerized?tab=readme-ov-file#1-nvidia-ampere-hopper-or-ada-lovelace-gpu-with-minimum-12gb-vram

swagonflyyyy 🏆 +1 • 54d

Use transformers to run florence-2-large-ft. Make sure to put the model in CUDA and modify the parameters for each task. You'll be blown away

nodating 🏆 • 54d
Ollama

Good investigation and analysis, thanks for sharing.
